HOW DOES ANALYTICS SUPPORT OUR GDPR COMPLIANCE?

Groupcall Analytics offers incredible insight into your MIS data as well as data from selected third parties, giving you a joined-up view across your Trust and the means to make comparisons between schools at a national, regional or individual level.

Access to data

One of the great things about using Analytics in your Trust is the number of people who will benefit from access to it. Because of the range of data used, Groupcall Analytics has been designed with security at its heart, leveraging the secure transfer and **audited data sharing** of Xporter on Demand. This is built on the exhaustive layers of **Microsoft PowerBI security,** and using Microsoft Azure to safely and automatically aggregate your data.

Because Groupcall Analytics is deployed into **your Trust's own PowerBI tenancy**, you can manage your staff's access to data, giving you **role-based access control** at a per user level. Because your PowerBI tenancy is not shared with any other organisations, you have full control of security policies and procedures applied to your users. To learn more about security and compliance features in Microsoft PowerBI please search online for "PowerBI Security Whitepaper".

The reports and dashboards within Analytics have been designed to provide a split between those that only report **aggregate summary data**, those that include drill-down into **specific student records**, and those that enable simple visualisation of **public datasets**. This enables you to control exactly which users can use the platform to view personal data and which can only see information in aggregate without individual identifiers.

Individual Data Controls

Because Analytics uses Groupcall's Xporter on Demand platform you can easily control whether to **exclude certain individuals** from the Analytics platform, giving you full control over the movement of personal data on a person-by-person basis.

Personal data rights

Under GDPR the rights of an individual to request the data held about them is removed by your organisation becomes stricter. Analytics will be providing a means to obtain a **Subject Access Request** which reports all the personal data held by the service for a selected person within your organisation. This report is provided in Microsoft Office so you can easily manage the safe and secure storage of your due diligence. We will also be adding a **Right to be Forgotten** wizard which will enable you, in suitable cases, to fully remove an individual from the Analytics platform.
